Proven demo: recording script

2-minute cut (1:58) · 15 lines · 3 speakers · video: out/proven-demo-2min.mp4

How to record

- Record each line as its own take, named **line-01.wav** to **line-15.wav**.
- Start at "Start" and finish before "End by". The pace is calm, about two words a second. If a take runs long, say it again; do not rush.
- Say numbers exactly as written. Words in **bold** take the stress.
- Play the video muted while you read: the subtitles show the same words at the right moment.
- Do not add a number that is not on screen, and do not say the local model matches Sonnet. It does not yet.

Running order

#	Who	Start	End by	On screen
01	A	0:00.5	0:07.5	The sentence "Legal costs rose $90K because of our Series B"
02	B	0:08.5	0:12.5	Commentary pasted into the console, Verify pressed
03	B	0:13.0	0:18.0	Verdicts and the Coverage panel
04	B	0:18.0	0:24.0	Claim 1 fails: stated $90K, ledger +$44,900
05	B	0:24.5	0:31.5	The $45,100 invoice booked to Marketing
06	B	0:32.5	0:40.0	Second company, Claude Sonnet as proposer
07	B	0:40.5	0:48.5	Claim marked REVIEW, matched on "campaign"
08	C	0:49.5	0:57.5	Safety gate result: safe
09	C	0:58.0	1:05.5	Reviewer ticks the box, records; claim turns PASS
10	C	1:06.5	1:17.0	Third company, Rules (offline), claim passes
11	A	1:18.0	1:28.5	Architecture diagram
12	A	1:29.0	1:39.5	100% blocked, 100% never rejected, then 81.7%
13	A	1:40.0	1:48.0	Pre-registered test: 100% of 429 blocked
14	A	1:49.0	1:53.5	"Your machine" box
15	A	1:54.5	1:57.0	Proven wordmark

A Speaker A

Opens, explains the architecture and the proof, closes. 6 lines, 43.0 seconds.

01 0:00.5 to 0:07.5 7.0 s — On screen: The sentence "Legal costs rose $90K because of our Series B"

Every month-end close, finance teams explain **why** each number moved. Proven **checks** those explanations against the ledger.

11 1:18.0 to 1:28.5 10.5 s — On screen: Architecture diagram

The model only **proposes**; its reply has no verdict field. Deterministic code **decides** from the ledger, and each confirmed lesson moves work from people to rules.

12 1:29.0 to 1:39.5 10.5 s — On screen: 100% blocked, 100% never rejected, then 81.7%

On every benchmark, **every** wrong explanation is blocked, and **no** correct one is rejected. On eleven unseen companies, with Sonnet proposing, almost **eighty-two percent** are decided.

13 1:40.0 to 1:48.0 8.0 s — On screen: Pre-registered test: 100% of 429 blocked

Then we **froze** the checker, wrote thirteen new companies, and scored **once**: **all** four hundred twenty-nine wrong explanations were blocked.

14 1:49.0 to 1:53.5 4.5 s — On screen: "Your machine" box

Next: a **local** open-weight proposer, so no sentence leaves the building.

15 1:54.5 to 1:57.0 2.5 s — On screen: Proven wordmark

The model proposes. The **ledger** decides.

The technical points in your lines

Know these so you can stress the right words, and answer if a judge asks.

Propose / decide split (line 11)
The model's reply format has no verdict field, so it cannot approve anything. A deterministic checker written in standard-library Python decides from the ledger.

Pre-registered test (line 13)
We committed the industries and the pass bar, froze the checker, and only then wrote 13 new companies and scored once. 0 of 429 wrong explanations passed; 0 of 1,193 correct ones failed.

Exact confidence bound (on screen, line 13)
From zero misses in 429 we state an exact Clopper–Pearson bound: at 95% confidence at least 99.3% of wrong explanations are blocked, counting claims. Counting whole companies (13) the bound is much wider, 20.6%; say so if asked.

Unseen-company benchmark (line 12)
11 companies in industries never used in development, reworded phrasing, Claude Sonnet proposing: 81.7% of claims decided after teaching.

B Speaker B

Walks through the product: verify, a failed claim, a model proposing. 6 lines, 37.5 seconds.

02 0:08.5 to 0:12.5 4.0 s — On screen: Commentary pasted into the console, Verify pressed

Paste the month's commentary and press **Verify**.

03 0:13.0 to 0:18.0 5.0 s — On screen: Verdicts and the Coverage panel

Each claim gets a **verdict**, and Coverage shows how much was checked.

04 0:18.0 to 0:24.0 6.0 s — On screen: Claim 1 fails: stated $90K, ledger +$44,900

Legal says **ninety** thousand; the ledger shows about **forty-five**.

05 0:24.5 to 0:31.5 7.0 s — On screen: The $45,100 invoice booked to Marketing

The evidence shows why: a forty-five-thousand-dollar Series B invoice was booked to **Marketing**.

06 0:32.5 to 0:40.0 7.5 s — On screen: Second company, Claude Sonnet as proposer

Here a language model proposes the claims. It sees the text and chart of accounts, **never** a transaction.

07 0:40.5 to 0:48.5 8.0 s — On screen: Claim marked REVIEW, matched on "campaign"

Its word, **campaign**, found the cause. But only the model's word supports it, so the claim **waits for a person**.

The technical points in your lines

Know these so you can stress the right words, and answer if a judge asks.

Blind proposer (line 6)
The model sees only the explanation text and the chart of accounts. It never sees a transaction, so it cannot fit its answer to the books.

Provenance-aware verdicts (line 7)
The checker tracks where each search word came from. Support that rests only on a model's word can never PASS; it becomes REVIEW and waits for a person.

Misclassification finding (line 5)
The checker found the missing half of the claim booked to another account, and showed that moving it back gives exactly the stated $90,000.

C Speaker C

The safety gate, teaching once, the next close. 3 lines, 26.0 seconds.

08 0:49.5 to 0:57.5 8.0 s — On screen: Safety gate result: safe

The safety gate replays the lesson against explanations with known answers: **no** wrong one passes, and **no** right one fails.

09 0:58.0 to 1:05.5 7.5 s — On screen: Reviewer ticks the box, records; claim turns PASS

The reviewer checks the two transactions and confirms it **once**. The claim passes.

10 1:06.5 to 1:17.0 10.5 s — On screen: Third company, Rules (offline), claim passes

On the next close, at **another** company, the rules run alone. The same reason passes on the learned word. No model ran; **nothing left the machine**.

The technical points in your lines

Know these so you can stress the right words, and answer if a judge asks.

Safety gate (line 8)
Before a lesson is stored it is replayed against explanations with known answers. It is rejected if any wrong one would pass or any right one would fail.

Teaching loop (lines 9–10)
A reviewer confirms a lesson once. From then on the rules decide that reason alone, at any company, with no model call and nothing leaving the machine.

Why it compounds (line 10)
Each confirmed lesson moves work from people and the model to deterministic rules, so the share decided without a person rises with use.

What is technically new, in one page

Every item below is said or shown in the video. The line that covers it is in brackets.

1. The model can only propose (lines 6, 11)
Its reply has no verdict field, and it sees the explanation and chart of accounts but never a transaction. Deterministic code decides every PASS, FAIL or REVIEW from the ledger.

2. Verdicts track where the evidence came from (line 7)
If the only support for a claim is a word the model suggested, the claim cannot pass. It waits for a person.

3. A safety gate on every lesson (line 8)
A lesson is replayed against explanations with known answers before it is stored, and refused if one wrong explanation would pass or one right one would fail.

4. Teaching moves work from the model to rules (lines 9, 10)
One confirmed lesson decides the same reason at another company with no model and nothing leaving the machine.

5. Two kill criteria held on every benchmark (line 12)
No wrong explanation passed and no correct one failed, at every teaching step, including 11 unseen companies where 81.7% of claims were decided.

6. A test registered in advance, with a stated bound (line 13)
Checker frozen, 13 new companies written afterwards, scored once: 429 of 429 wrong explanations blocked, 1,193 of 1,193 correct ones not rejected. At 95% confidence at least 99.3% are blocked, counting claims.

If a judge asks

- **"Is 100% real?"** Yes, on these tests, and the counts are on screen. The honest general claim is the bound: at least 99.3% at 95% confidence by claims; by whole companies (13) it is much wider.
- **"Does it need Claude?"** Only to propose. In the demo the Sonnet step replays saved Sonnet answers, and the console says so. Decisions never depend on the model.
- **"What about a local model?"** In progress. Our fine-tuned open models do not match Sonnet yet; that is the next step, not a result.
- **"How big is the code?"** The checker is standard-library Python with 412 tests.
